

## **AMENDMENTS TO THE CLAIMS**

Claims 30-47, 61, and 62 are pending in the present application. Claims 30, 46, and 61 are currently amended and Claims 39-45 and 62 are cancelled herein. Therefore, Claims 30-38, 46, 47, and 61 are presently under examination. This listing of claims will replace all prior versions and listings of claims in the application.

### **Listing of Claims**

Claims 1-29 (Previously cancelled).

Please cancel Claims 39-45 and 62.

30. (currently amended) A catalyst composition comprising:

1) the product resulting from the combination of:

a) a ~~non-fluorinated~~ chromium catalyst having a pore volume of at least 1.8 cc/g and a surface area of at least 400 m<sup>2</sup>/g produced by contacting a chromium-containing, titanium-containing, silica-containing solid with carbon monoxide under conditions such that a substantial portion of the chromium is in the divalent state after contacting with carbon monoxide; and

b) a cocatalyst, wherein the cocatalyst is selected from i) an alkyl lithium or aryl lithium compounds; ii) ~~dialkyl aluminum alkoxides in combination with at least one compound selected from alkyl zinc compounds, alkyl aluminum compounds, alkyl boron compounds, or mixtures thereof; or~~ iii) mixtures thereof; and

2) a Ziegler-Natta catalyst composition produced by combining a halide of a metal selected from titanium, vanadium, or zirconium and an organoaluminum compound.

31. (previously added) A catalyst composition according to claim 30 wherein said cocatalyst comprises an alkyl lithium compound.

32. (previously added) A catalyst composition according to claim 31 wherein said alkyl lithium compound has 1 to 12 carbon atoms.

33. (previously added) A catalyst composition according to claim 31 wherein said alkyl lithium compound has 1 to 5 carbon atoms.

34. (previously added) A catalyst composition according to claim 33 wherein said alkyl lithium compound comprises n-butyl lithium.

35. (previously amended) A catalyst composition according to claim 34 wherein the alkyl lithium compound is used in an amount so as to give an atom ratio of lithium to chromium in the range of about 0.5:1 to 10:1.

36. (previously added) A catalyst composition according to claim 34 wherein the chromium catalyst contains about 0.5 to about 5 weight percent chromium and about 0.1 to 7 weight percent titanium.

37. (previously amended) A composition according to claim 30 wherein said lithium compound is used in an amount so as to give an atom ratio of lithium to chromium within a range of about 0.5:1 to about 10:1.

38. (previously added) A composition according to claim 30 wherein the chromium catalyst is prepared by calcining a chromium-containing, titanium-containing, silica-containing solid with oxygen at a temperature in the range of about 400 to about 900 degrees C to convert a substantial portion of the chromium to the hexavalent state and then contacting the calcined product with carbon monoxide at a temperature in the range of about 300 to about 500 degrees C to convert a substantial portion of the chromium to the divalent state.

39-45 (Cancelled).

46. (currently amended) A dual catalyst composition comprising:

1) a polymerization catalyst system comprising a chromium catalyst composition resulting from the combination of

a) a ~~non-fluorinated~~ chromium catalyst having a pore volume of at least 1.8 cc/g and a surface area of at least 400 m<sup>2</sup>/g produced by contacting a chromium-containing, titanium-containing, silica-containing solid with carbon monoxide under conditions such that a substantial portion of the chromium is in the divalent state after contacting with carbon monoxide; and

b) a cocatalyst, wherein the cocatalyst is selected from i) ~~an alkyl lithium or aryl lithium compounds;~~ ii) a dialkyl aluminum alkoxides alkoxide in combination with at least one compound selected from alkyl zinc compounds, alkyl aluminum compounds, an alkyl boron compound compounds, ~~or mixtures thereof;~~ or iii) ~~mixtures thereof;~~ and

2) a Ziegler-Natta catalyst composition produced by combining a halide of a metal selected from titanium, vanadium, or zirconium and an organoaluminum compound.

47. (previously amended) A catalyst composition according to claim 46 wherein the organoaluminum compound of the Ziegler-Natta catalyst composition comprises triethylaluminum.

Claims 48 – 60 (Previously cancelled).

61. (currently amended) A catalyst composition comprising:

1) the product resulting from the combination of:

a) a ~~non-fluorinated~~ chromium catalyst having a pore volume of at least 1.8 cc/g and a surface area of at least 400 m<sup>2</sup>/g; and

b) a cocatalyst, wherein the cocatalyst is selected from i) an alkyl lithium or aryl lithium compounds; ii) dialkyl aluminum alkoxides in combination with at least one compound selected from alkyl zinc compounds, alkyl aluminum compounds, alkyl boron compounds, or mixtures thereof; or iii) mixtures thereof; and

2) a Ziegler-Natta catalyst composition produced by combining a halide of a metal selected from titanium, vanadium, or zirconium and an organoaluminum compound;

wherein the chromium catalyst consists essentially of a chromium-containing, titanium-containing, silica-containing solid that has been contacted with carbon monoxide under conditions such that a substantial portion of the chromium is in the divalent state after contacting with carbon monoxide.
